

ABSTRACT

5 A multi-unit termination accessory for flashing certain through-wall
openings in a building. The multi-unit termination accessory unit is thermo-
formed in multiples of four with clearly delineated cutting lines for separating the
multi-unit flashing member into four identical termination accessory units for use
in corners of frame construction rough openings. This multi-unit forming permits
multiple units to be formed in a single molding, thus reducing the time and cost
10 per unit. Additionally, the individual termination accessory units are provided
with a feature that permits their use with either full depth or partial depth
windows thus increasing their versatility and acceptance by the construction
industry.
